My Site – Moveo exercise

In this exercise I created database using firestore cloud, which contains five users. Each user has a name, email, password, birth date and address fields.

I created, using react, two pages: login page and a profile page. In the login page the user enters his email address and password and press the login button, if the details he entered are not correct, meaning that these details are not in the database, it opens a message saying that he failed to log in. If the details he entered are correct, he moves on to the next page, which displays his matching details from the database.

To run the project, go to https://yaelhava.github.io/MySite/ and to login use:

Email: rachel@mail.com
